

LEARN MORE ABOUT PHILLY NEIGHBORHOODS

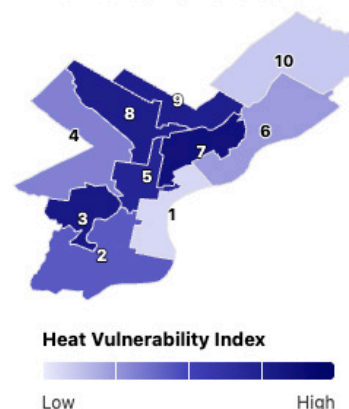

The Philadelphia City Council District Health Dashboard

We're excited to launch the Philadelphia City Council District Health Dashboard—an interactive tool that lets residents, policymakers, and advocates explore key health, education, and equity data across the city's ten council districts. Users can visualize and compare data on:

- Key Health Indicators
- Social Determinants
- Policy-Related Metrics
- And more!

Heat Vulnerability Index

The Heat Vulnerability Index (HVI) is a composite measure that summarizes key indicators associated with negative health outcomes due to extreme heat exposure. The HVI scale ranges from negative to positive values, which represent areas of very low to very high vulnerability.

Source: Open Data Philly (Department of Public Health) (2019)

Initial Findings

Early data shows district-level disparities in health and social conditions, highlighting the need for place-based policy and planning:

Areas With Some Of The Lowest Rates of College Graduates Have Some Of The Highest Rates of Home Ownership

- Districts 7, 6, 9, and 10 all hold some of the lowest rates of residents with a college degree, and are below the city's average. However, these same Districts hold some of the highest rates of home ownership – well above the city's average and contrary to the trend exhibited across the country by the US Census Bureau.

Vulnerability to Heat Waves Varies Significantly Across Districts

- By comparison, District 7, which includes neighborhoods like Kensington, Frankford, and Hunting Park, is nearly 200% more vulnerable to heat waves than District 1, which holds neighborhoods like Old City, Society Hill, East Passyunk, and Northern Liberties.

More Than 1 in 4 Of All Buildings in Districts 3 and 5 Have Open Housing Code Violations

- These areas, which include West/Southwest Philly and much of Center City respectively, also have the largest number of renters in the city.

University City Offers Insights For Reducing Traffic Fatalities

- District 3, home to University City, has one of the lowest fatal crash rates (54), suggesting more effective traffic safety measures than in other districts.

Our goal is to equip local officials, community leaders and the public with actionable, district-level insights that can guide and empower more equitable policy and investment into our city. By connecting this data to City Council Districts, we hope this project continues to grow and support effective solutions that can promote equality and better health for all Philadelphians.
